How to avoid costly plumbing problems

A free guide from Local Hub

1. **Know where your main shut-off valve is.** Find it today and make sure everyone in the home can reach it quickly in an emergency.
2. **Fix small drips early.** A dripping tap or running toilet wastes water and often points to a worn part that is cheap to replace now and costly later.
3. **Be careful what goes down the drain.** Keep grease, wipes and food scraps out of sinks and toilets to prevent blockages.
4. **Protect pipes in cold weather.** Insulate exposed pipes and keep heat on in unused rooms to avoid freezing and bursting.
5. **Check under sinks and around appliances.** Look for damp, stains or musty smells every few months so leaks are caught before they damage floors and walls.
